

focus on what's important

Sometimes even expensive, high quality hearing instruments can't bring you the clarity your patients had hoped for. Now there's Conversor®.

Designed specifically for use with T-coil equipped hearing instruments or cochlear implants, Conversor consists of a compact wireless FM microphone/transmitter and a lightweight receiver. A new world of clear, vastly improved sound can be transmitted to the receiver - and to the wearer's hearing instrument - from up to 150 feet away! Patented Technology reduces unwanted background noise up to 30 dB, and the microphone's zoom or directional settings allow tailored reception for any environment.

There's only one Conversor. And only one place to get it in North America. Westone. Contact us today for more information.
